```
main.c
1 #include <stdio.h>
2
3 int main()
4 {
5     int block[5]={100,500,200,300,600};
6     int process[4]={212,417,112,426};
7
8     for(int i=0;i<4;i++)
9     {
10         int best=-1;
11
12         for(int j=0;j<5;j++)
13         {
14             if(block[j]>=process[i])
15             {
16                 if(best==-1 || block[j]<block[best])
17                     best=j;
18             }
19         }
20
21         if(best!=-1)
22         {
23             printf("Process %d allocated to block %d\n", i+1, best+1);
24             block[best]--process[i];
25         }
26         else
27             printf("Process %d not allocated\n", i+1);
28     }
29
30     return 0;
31 }
```

Output

```
Process 1 allocated to block 4
Process 2 allocated to block 2
Process 3 allocated to block 3
Process 4 allocated to block 5

=== Code Execution Successful ===
```
